

Procedure: Dropping biometrics and encounter tables in ABIS Database

Important Note

⚠ Dropping the biometrics and encounter tables will **permanently delete all enrolled records** from the ABIS database.

Step 1: Stop the Matcher Services

Ensure all matcher services are stopped before proceeding with database operations.

Step 2: Connect to PostgreSQL

Connect to the ABIS database using the PostgreSQL client.

```
psql -h <DB Server IP> -p <DB Port> -U <DB USER> -d <DB NAME>
Password: *****
```

Step 3: Drop the Tables (biometrics and encounter)

```
=> DROP TABLE IF EXISTS biometrics;
=> DROP TABLE IF EXISTS encounter;
```

Step 4: Exit psql

```
\q
```

Step 5: Start the Matcher Services

After the tables are dropped successfully, start the matcher services and verify that they initialize correctly.

```
>> Ensure containers/pods move to Running state
>> Check logs to confirm the service is connected to Database
```
